## table

- Yet another datatype, in between a cell and a structure.
  - Arrays in tabular form whose named columns can have different types. Each variable in a table can have a different data type and a different size with the one restriction that each variable must have the same number of rows.
  - A container to hold data and metadata such as variable names, row names, descriptions, and variable units, together.
- Suitable for holding heterogeneous data.
  - Tables are useful for mixed-type tabular data that are often stored as columns in a text file or in a spreadsheet.
  - Tables consist of rows and **column-oriented variables**.
- Since R2013b

5

## table: creation

- File: *demo\_tables.mlx*
- Create a table from:
  - Existing workspace variables using `table` function
  - Import from a file into a table using:
    - Import Tool
    - `readtable` function.
- Get some information about a table:
  - `summary` function
  - `properties` function

## table: selecting elements

- Selecting elements from a table
  - works the same way as with cell arrays
  - use `()` to select the container, `{}` to select the content
  - *Named* selection is also possible
    - Use the dot operator to select a variable (column)
- Row can also be named
  - `Properties.RowNames`

## Matlab date and time

- <https://nl.mathworks.com/help/matlab/date-and-time-operations.html>
- `help timefun`
- The date and time data types are:
  - `datetime`
  - `duration`
  - `calendarDuration`

11

## datetime arrays

- File: *demo\_datetime.mlx*
- support arithmetic, sorting, comparisons, plotting, and formatted display
- Creation: `datetime` function
  - Relative day
  - Date strings
    - Character string
    - Cell array
    - string
